OVERVIEW

Zorg Biogas offers a solution to process vinassa condensate into biogas.

Vinassa condensate contains less water with the same quantity of organic meters and biogas yield. As the result the volume of tanks is less. Less tanks means less pumping equipment, number of valves, and other support equipment.

The produced biogas is used to replace oil fuel 6 in an existing boiler room. A proven technology of vertical CSTR reactor with a central agitator is used. The vertical shape provides the optimal mass and heat transfer, as a result the biogas plant consumes very little electric energy. To compare different concepts of biogas plant it is necessary to pay attention not only to the price, but also to the quality and small but very important details. The temperature is maintained with an accuracy of $0,1^{\circ}\text{C}$. The roof of the reactor and next two rows of rings are made from stainless steel. There is a double filtration of biogas, which save burners life. The biogas plant is equipped with a modern laboratory. Biogas plants has a lot of features, which are known only to the experienced company. For example, operational temperature, foam safety valves, micro-elements and etc.

After the biogas plant pretreated effluent is a better fertilizer than vinasse. Because in vinasse the microlements are bound with organics. In the digester mass the microlements are in the free form. For example, nitrogen is in ammonia form and not in the form of protein.

Raw material potential

Season-1 (180-days). Juice and syrup vinasse

Biogas plant working principle

The technology is based on the biochemical conversion of organic materials from high molecular weight compounds to low molecular weight compounds. The first stage of this process is hydrolysis. Hydrolysis produces organic acids and alcohols.

Organic compounds + $H_2O \rightarrow C_5H_7NO_2 + HC_3O_3$.

Further conversion of obtained dissolved compounds like organic acids and alcohols ($C_5H_7NO_2, HC_3O_3$) into gases - CH_4, CO_2 . $C_5H_7NO_2 + HC_3O_3 + H_2O \rightarrow CH_4 + CO_2 + NH_4$.

Biological process of consecutive (phasic) conversion of organic compounds take place in anaerobic environment i.e. in oxygen-free tank (biological reactor). At the first stage of fermentation, substrate hydrolysis take place under acidogenic bacteria influence. At the second stage, elementary organic compounds come through hydrolysis oxidation by means of hetero-acidogenic bacteria with production of acetate, carbon dioxide, and free hydrogen. The

other part of the organic compound including acetate forms C_1 compounds (elementary organic acids). Produced substances are the feedstock for methanogenic bacteria of the third type. This stage flows in two processes of A and B type the character which depends on caused by different bacteria type. These two types of bacteria convert the compound obtained during the first and second stages into methane CH_4 , water H_2O and carbon dioxide CO_2 . Methanogenic bacteria are more sensitive to the living environment compared to acidogenic bacteria. They require a complete anaerobic environment and a longer reproduction period. The speed and scale of anaerobic fermentation depends on bacteria metabolic activity. That is why the biogas plant chemical process includes hydrolysis stage, oxidation, and methanization stage. For that kind of substrate, these processes take place in the same reactor

Technological process of biogas production

The vinassa condensada is directed into receiving tanks. The temperature of vinasse must be controlled and sustained in a necessary range. From the receiving tanks vinasse is pumped to reactors by pumps.

In the reactor the substrate is brought up to a temperature of +52°C. Constant temperature is sustained for the entire digesting period. To prevent a rise in temperature the biogas plant is equipped with a coolers (dry cooling). The reactors' operating regime is thermophilic. The heated substrate in the digesters is blended periodically. Mixing is performed by a central vertical agitator. The average retention time in the reactor is 23 days for the first season and 34 days for the second season. After the reactor, the substrate is fed to a buffer tank, from were it used for field watering like as liquid bio-fertilizer. Biogas goes up under overlaps and delivered into a gasholder through pipeline. The gasholder system has a two-layer construction. The gas holder's weather protective film protects the gasholder from precipitation and damage by foreign objects. To protect the gasholder from overpressure, digester is equipped with safety valve, which start working at a pressure of 5 mbar and bleeds biogas to the atmosphere.

Then accumulated in the gasholder biogas goes through a gas pipeline to a biogas cooler with a condensate discharge unit and then to a compressor, where the pressure is raised up to 80-150 mbar to meet engine requirements. After the compressor, biogas is fed to activated coal filter to remove hydrogen sulfide (H₂S). After the filter, biogas goes to biogas upgrading plant where raw biogas treats through the removal of CO₂ and other soluble gases to produce primarily methane gas (~99%) which is clean and dry and has the same characteristics as natural gas.

All technological processes are controlled and operated by an automatic system. Biogas plant work is monitored at the central control room monitor. The control room is equipped with a central control unit, which allows the switching of any biogas plant module into automatic or manual mode with local or remote control.

MAIN EQUIPMENT

Receiving tank and digested substrate tank

Reservoir for reception of liquid kinds of raw materials. Tank is equipped with level sensors and side agitators for mixing raw materials. Tanks serve as a buffer for collection substrates and then to supply substrates to points of biogas plant according the technological process.

Specifications

Receiving tank

Diameter:	8,54 m
Height:	6,36 m
Volume:	365 m ³
Quantity:	1 pcs.

Filtrate tank

Diameter:	8,54 m
Height:	6,36 m
Volume:	365 m ³
Quantity:	1 pcs.

Plates (tank wall enameled, roof)
 Flange, nozzle, lap joint flanges outside
 Control glass
 Ex light
 Manhole
 Ladder, stair and walkway
 Brackets and clamps for pipe along tank edge
 (internal/external)

Side agitator (AG-02, AG-03)

Side mixers are used in biogas reactors and receiving tanks for mixing medium and low viscosity substrates. When installed on a metal tank, the stirrer is attached to a support column. The agitator drive is located outside, and a shaft with a screw goes into the reactor through a flange installed in the wall. Installation through a flange prevents the transfer of forces from the agitator to the tank walls. Suitable for use in aggressive environments with a dry matter content of up to 11 %. The special design of the shovel-like blades works good both with mixing different types of substrates and breaking up floating layers and crust.

Specifications

Receiving tank:

Engine power:	5,5 kW
Quantity per tank:	1 pcs
Quantity total:	1 pcs

Digested substrate tank:

Engine power:	5,5 kW
Quantity per tank:	1 pcs
Quantity total:	1 pcs

Reactor (RT-01)

Reactor is an important part of a biogas plant made of enameled sheet metal. The steel digester is installed on a concrete basis. A layer of enamel protects the surface of the entire metal structure. The enamel is vitreous and very resistant to aggressive pH and mechanical damage. Enameled digester assembled from steel segments. Such a digester is quickly and safely mounted. Steel panels are joined on bolted joints with a special sealant. The enamel coating is layered according to the PUESTA method. This is a special powder that is laid in layers by electrostatic attraction. Thus, uniformity of coating, density and smooth

Specifications

Height:	20,24 m
Diameter:	22,66 m
Total volume:	8150 m³
Substrate volume	7820 m³
Quantity:	1 pcs.

Plates (tank wall enameled, roof)
Flange, nozzle, lap joint flanges outside
2 off control glass 2 x DN 250 with water flush
Ex light
Manhole
Ladder, stair and walkway
Brackets and clamps for pipe along tank edge
(internal/external)

Reactor central vertical agitator (AG-01)

The agitator is fixed to the center of the rigid overlap of the fermenter. Mixer blades are designed in different directions. This design of the blades helps to create a lifting force that lifts the substrate from the bottom of the digester to the top of the tank. The upper blades rotate distributing the substrate along the digester, directing the flow downward. The agitator works constantly, mixing the substrate in the digester all the time

Specifications

Engine power: 35 kW

Quantity per reactor: 1 pcs

Total quantity: 1 pcs

Window with spotlight (SG-01)

Inspection windows are designed for visual control of processes inside the fermenter. Spotlights were made in explosion-proof with automatic disconnection. Inspection windows are equipped with a cleaning washing system.

Specifications

Inspection windows: Ø300

Spotligh:
VISULUX UL50 -G -H 230V, 50W, IP65

Pump equipment

Pumps are used to transport substrate to the equipment and facilities in the biogas plant and away. Biogas plant design allows to access easily to all pumps. Pumps are driven by helical geared motor. Stator has hopper inlet for optimum filling of the pumping chamber, wear-protected, robust universal joint with feeding screw, robust bearing pedestal with close-coupled drive and self-centering of the drive shaft. Pumps have modular design for high flexibility, low life-cycle-costs.

Specifications

Substrate feed pump

Engine power:	18 kW
Flow rate:	60 m ³ /hour
Pressure:	4 bar
Quantity:	1 pcs

Substrate circulation pump

Engine power:	11 kW
Flow rate:	40 m ³ /hour
Pressure:	4 bar
Quantity:	1 pcs

Substrate digested pump

Engine power:	11 kW
Flow rate:	40 m ³ /hour
Pressure:	4 bar
Quantity:	1 pcs

Discharge pump

Engine power:	18 kW
Flow rate:	60 m ³ /hour
Pressure:	4 bar
Quantity:	1 pcs

Gasholder (GH-01)

The gasholder provides for biogas storage and for equalizing pressure and biogas composition. The gasholder system has a two-layer construction. The external material consists of a weather-proof film of PVC-coated polyester fabrics with UV protection. Both sides are finished with an external N/5cm, internal membrane PELD (gasholder) membrane.

The gasholder has a methane permeation maximum of $260 \text{ cm}^3/\text{m}^2 \cdot 1 \text{ bar}$ biogas resistance. The gasholder film temperature range allows operation from -30°C to $+60^\circ\text{C}$.

The internal film is stretched under normal biogas pressure. Air is blown into the space between the external and internal membranes to pressurize the internal membrane and form the shape of the external membrane.

The biogas pressure in the gasholder is 2-5 mbar. The membranes are designed and cut out on NC machines. Welding is executed by high frequency currents. These steps yield substantial improvements for quality and service life compared to handmade membranes welded by standard welding equipment.

To prevent damage to the gasholder as a result of overpressure conditions, a safety valve is installed. To survey the internal membrane, an inspection window is installed on the external membrane.

Specifications

Height:	13,2 m
Diameter:	9,9 m
The total volume :	1010 m ³
Quantity:	1 pcs

Biogas drying and cooling (CHL-01)

Biogas drying and cooling are provided with special equipment as GAS COOLER and AIR-COOLED LIQUID CHILLER. Biogas plants thanks to an extensive range of dedicated Biogas solutions, low pressure heat exchangers, a comprehensive range of water chillers and RWD Dry Coolers. Designed as one-way shell-and-tube heat exchanger. Process gas inside of the tubes; cooling water in the shell. All parts in contact with the process gas made of stainless steel 316Ti or 316L; heat exchanger shell made of stainless steel/ Designed with gas outlet chamber outlet connection radial; inspection opening axial Official acceptance according to PED 2014/68/EU in accordance with ADMerkblätter and factory pressure test.

Specifications

Gas volume flow:	1750 m ³ /hour
Gas inlet temperature:	+55°C
Gas outlet temperature:	+20°C
Electric power:	56 kW
Quantity:	1 pcs

Biogas compressor (BC-01, BC-02)

Biogas blower is a device used to move gas and increase pressure thanks to a rotating impeller within a toroidal channel, so there is a progressive increase of energy.

Blower is used to transporting biogas from gasholder storage to consumer (biogas upgrading plant in our case).

Specifications

Flow rate:	1900 m ³ /hour
Pressure:	150 mbar
Engine power:	20 kW

Quantity:	2 pcs
-----------	-------

Desulphurization system

The desulphurization system is a 3-step system. Stage 1 is adding reagent directly into reactor. Stage-2 is introducing a controlled amount of air (oxygen) into the anaerobic digester. This process creates a microaerobic environment where sulfur-oxidizing bacteria (SOB) utilize H_2S and oxygen to produce elemental sulfur, effectively reducing H_2S levels in the biogas. Stage 3 – post-treatment with activated charcoal filtration, as activated charcoal has the capability to absorb sulfur. After passing through activated charcoal filters, the sulfur concentration is reduced to 0 ppm.

Specifications

Charcoal filter (CF-01...CF-06)

The volume of charcoal:

500 kg

Quantity:

2 pcs

Gas analyzer (CH₄, CO₂, H₂S) (GA-01)

Gas analyzer - a measuring device to determine the qualitative and quantitative composition of the gas mixture. In a biogas plant's installed absorption gas analyzers, biogas mixture components are absorbed sequentially with various reagents. Automatic gas analyzers continuously measure any physical or physicochemical characteristics of the gas mixture or its individual components. Operation is based on physical methods of analysis, including auxiliary chemical reactions.

Specifications

Set includes
Device for wall mounting
LCD display menu
Flow meter / control valve
Sensors

Quantity:

1 pcs

Defined gases methane % (CH₄), carbon dioxide % (CO₂), hydrogen sulfide ppm (H₂S)

Flare (BF-01)

Flare is designed for the temporary or periodical complete combustion of the biogas produced by biogas plants without the possibility of its use as an energy source. The burn system consists of a burner and additional equipment. The burner is designed on the principle of injection and consists of a combustion nozzle with an injector with an air supply control system, flame protection tube, fitting and burner control system. The biogas combustion system is made of stainless steel.

The supporting structure holds the burner and vertically mounted socket. The burn control system is installed in a case, which is mounted on the supporting structure of the combustion system and contains all the elements for monitoring and controlling ignition and flame.

Specifications

Flow rate:	1750 m ³ /hour
Pressure:	min 10 mbar- max 60 mbar

Quantity:	1 pcs
-----------	-------

Water supplying and sewerage system

Water supplying system provides biogas plant feed water, water for network circuits, the domestic water and fire safety systems. As used centrifugal single stage pumps as main pumping elements. These pumps are designed for pumping waste water, household / domestic water and sewage. Pressure Boosting Systems are designed for pure water pressure boosting in industrial plants. The booster comprises 2 to 3 (connected in parallel pumps) installed on a common base frame, and provided with all the necessary fittings.

Specifications

Drain pump
Pressure 4m
Flow 2-3 m³ / h
Engine 0,24 kW

Equipment
Pump case control
Stove-base
gauges
Check valves
Float switches
Brackets
Valves

Heating system

Heating equipment is used for biogas plant heating and for sustaining constant temperature in the fermenter. Heating equipment includes circulation pumps, heat exchanger, heating manifold and pipes. The heat from the boiler is transferred to the biogas plant by using heat exchanger and then is pumped through of biogas plant by circulation pumps. A heat carrier prepares water with an additive of ethylene glycol. Inlet temperature in the fermenter is 60C, the outlet is 40C.

Specifications

Circulating pump feeding heat carrier

Engine power:	2,0 kW
Flow:	20 m ³ /hour
Pressure:	1 bar

Circulating pump feeding heat carrier

Engine power:	0,8 kW
Flow:	3 m ³ /hour
Pressure:	1 bar

The pumping station feeding propylene glycol

Engine power:	0,8 kW
Flow:	1 m ³ /hour
Pressure:	4 bar

Plate Heat Exchanger (HE-01, HE-02, HE-03)

As of today, the design of dismountable plate heat exchangers is the most advanced in the field of solving heat exchange problems. Dismountable plate heat exchangers with thermal capacities ranging from 5 kW to 30 MW can be implemented for various technological processes.

The collapsible plate heat exchanger consists of a frame and a set of heat transfer plates. The frame of the heat exchanger consists of movable and fixed plates, upper and lower guides and a rear stand. All heat exchanger plates in the package are identical in size, but are rotated 180 degrees relative to each other. This arrangement ensures alternating hot and cold channels. During the heat exchange process, the working fluids move towards each other (counter currently). The hot medium transfers heat through the plate wall. There are dozens of plate sizes available for the collapsible heat exchanger. And for each plate size, there are several corrugations. The combination of plates with different reliefs (corrugations) increases the number of possible combinations of heat exchange channels. All of this makes it possible to model a plate heat exchanger that is as close as possible to the specified power and losses.

Specifications

Volumetric capacity
Temperature
Working pressure

5 to 100 m³/h
up to 90°C
at 4 bar

Capacity of the heat exchanger for vinasse
Quantity:

900 kW
2 pcs

Capacity of the heat exchanger for substrate
Quantity:

600 kW
1 pcs

Dry cooler (cooling substrate system)

Device is designed to cool the substrate to working temperature according to technological regime. When use high temperature substrate, there is a chance of uncontrolled heating. The cooler is connected to the heating pipes, heat exchangers and it will be activated if it is need.

Specifications

Input substrate

Heat power: 300 kW

Electric power: 12 kW

Quantity: 2 pcs

Substrate in reactors

Heat power: 100 kW

Electric power: 4 kW

Quantity: 1 pcs

Automation and electrical equipment

Process control equipment is used for supervision and regulation operation of the plant and for the limitation of damage. In case of emergency (for example, breakdown of the electrical power supply) the biogas plant is automatically transferred to safe operating conditions by the process instrumentation. Critical electrically driven devices are supplied with emergency power. An automatic system allows the supervision of the plant in real time and to recognize and correct aberrations immediately; to run the plant at its optimum saving resources and costs; and to record for the electronic database operation parameters. The automatic system consists of a control cabinet and sensors for parameter control of technological processes and execution devices.

The control cabinet is designed based on the industrial controller Siemens CPU315-DP2, using periphery distributing system Simatic ET200S, and operator panel OP277 Touch with touch-sensitive controls. Communications is executed by PROFIBUS and MPI with physical interface RS-485. The control program is designed based on the Simatic Step7. The control cabinet is a modular design. The upper part has a power box with central and front-end processor. The periphery distributing system, Simatic ET200S, is installed with input - output units. The lower part with interface relay and clips is installed for connecting execution devices. The entire plant is controlled by a single operator.

Specifications

Incoming control case with automatic set ASE-1, 2, 3

Base Siemens CPU315-DP2 controller

Peripherals Simatic ET200S

Control panel OP277 touchscreen

Communication PROFIBUS and MPI

Laboratory

Monitoring and control of parameters of raw materials and fermentation processes is important for the efficient operation of a biogas plant. The laboratory allows you to assess the content of dry matter in the input raw materials, fermented mass, determine the ratio of volatile organic acids to total inorganic carbon (FOS/TAC parameter), determine the degree of substrate fermentation in fermenters, the level of biogas output, and evaluate the efficiency of separator.

Contracts

Project implementation is executed simultaneously under several contracts

- Engineering contract
- Equipment supply contract
- Supervision contract
- Start-up and training contract

List of exclusions :

- 1) Topographic and geological surveys 3000-7000 EUR
- 2) Electric transformer and the external electric line 60 kW for start-up, for construction period and 150 kW for normal operation.
- 3) External roads to the biogas plant.
- 4) Temporary water supply during the construction and the hydraulic test of reactors at least 1000 m³ water per day. It can be a technical quality water from a river, lake, well. Not salty.
- 5) Bacterial seed for the start-up. It can be biomass from another biogas plant. Possible also cow manure, any kind of manure, sludge from city sewage treatment plant. Customer needs to bring the seed one-time during a 1-2-week period and to fill with it at least 15-20% of the reactor volume 1400-1600m³. The rest is filled with the water item 5 above.
- 6) Machinery to transport raw material to and from storage to the solid feeders (a truck, a frontal loader, a tractor).
- 7) Activated carbon 0,2 tonne per 2 years x 4800 EUR/tonne = 960 EUR
- 8) Microelements 1176l per year x 25 EUR/l= 29 400EUR
- 9) Fe(Cl)3- 170 tonnes per year x 800 EUR/tonne = 136 000 EUR
- 10) Demineralized water to the heating system 6,0 tonnes,
- 11) Spare parts for 2 years - 90 000 EUR
